CHARGINGSTAGE LIBRARY

How to present an EV charging project

A project page should help a potential customer or partner understand what you delivered and decide whether to get in touch.

- [ ] **Name the project and the customer need**

  Lead with the location and use case, such as fleet depot, workplace or public charging. Explain the problem the customer needed to solve in one sentence.

- [ ] **Show what went into operation**

  State the project stage and the go-live date if available. Include the number of charge points, AC or DC, and the power per connector or shared across the site. Label planned capacity clearly.

- [ ] **Explain your part in the delivery**

  Say what your team handled, from site design and grid connection to installation, software or ongoing operations. Credit partners where you have their approval.

- [ ] **Give readers one result they can verify**

  Use a photo you have permission to share, a public case study or a measured result. If you quote a figure, give its unit and measurement period.

- [ ] **Make it easy to follow up**

  List the expertise shown in the project. Say where you can deliver similar work, and add a contact or a link for a specific next step.

Make your expertise easier to find

ChargingStage helps you find companies with the experience you need, or helps others find the expertise you offer.
